🥇 Use Case 1 (Core): Proactive Daily Planning

Problem

Managers don't know what to prepare → reactive decisions

Demo Capability

System:

- Predicts demand
- Generates:
  - "Today's Plan"
- Shows:
  - "Prepare 120 units of Item A (+25%)"
  - "Risk: Low stock of Ingredient X"

Why this wins

- Directly solves core problem
- Very clear before/after story
- Easy to demo

🥈 Use Case 2 (Support): What-If Simulation

Problem

Managers can't evaluate decisions before acting

Demo Capability

User asks:

"What if I reduce prep by 20%?"

System responds:

- “You risk stockout at 12:45 PM”
- “Service delay increases by 15%”

Why this wins

- Strong AI narrative
- Feels “intelligent”
- Great for demo interaction

🎬 Demo Story (Put It Together)

Scenario:

Friday lunch rush

Step 1 — Before (Pain)

Manager:

- Unsure what to prepare
- Makes guess

Step 2 — After (Your System)

System shows:

- “Demand will increase by 30% today”
- “Prepare more Item A”
- “Risk: Ingredient shortage at 1PM”

Step 3 — Interaction

Manager asks:

- “Why?”

System:

- Explains:
    - “Based on last 3 Fridays + promo”

Step 4 — Simulation

Manager:

- “What if I don’t increase prep?”

System:

- “You will run out at 12:50 PM”

Step 5 — Outcome

Manager:

- Confident decision
- No firefighting

🧠 AI-First Hackathon — Judge Q&A Cheat Sheet

Product: Smart Planning Copilot

🎯 Core Positioning (Use This Anchor)

"We're not building a dashboard—we're building a system that turns data into **timely, confident decisions**, enabling managers to operate **proactively instead of reactively**."

💧 1. Accuracy

Q: How accurate is your prediction?
A:

- Using heuristics for demo realism
- In production: historical data + seasonality + real-time signals
- We provide **confidence + reasoning**, not just numbers

👉 **Key line:**

"We optimize for better decisions under uncertainty, not perfect prediction."

⚡ 2. Why Not a Dashboard?

Q: How is this different from dashboards?
A:

- Dashboards = insight

- We = **decision + action**
    - Recommend what to do
    - Simulate outcomes
    - Surface risks proactively

👉 **Key line:**

"We eliminate the need for managers to interpret data under pressure."

🤖 3. Why AI?

Q: Why do you need AI?
A:

- Pattern detection (demand shifts)
- Natural interaction (copilot)
- Context-aware recommendations

👉 **Key line:**

"Without AI, you get data. With AI, you get decisions."

🔄 4. Integration

Q: How does this work with existing systems?
A:

- Sits as an **intelligence layer on top**
- Integrates via APIs/events:
    - POS
    - Inventory
    - Staffing

👉 **Key line:**

“We don’t replace systems—we connect and make them smarter.”

⏱️ 5. Real-Time Capability

Q: Is this real-time?
A:

- Planning mode (daily)
- Operational mode (event-driven updates)

👉 **Key line:**

“We move from static planning → continuous decision-making.”

📈 6. Business Impact

Q: How do you measure success?
A:

- ↓ Stockouts
- ↓ Waste / over-prep
- ↓ Decision time
- ↑ Service speed

👉 **Key line:**

“This directly impacts revenue and operational efficiency.”

🤝 7. Trust & Adoption

Q: Will managers trust this?
A:

- Explainability (“why”)
- Simulation before action
- Human always in control

👉 **Key line:**

“We augment—not replace—manager decisions.”

🧪 8. Failure Handling

Q: What if the system is wrong?
A:

- Confidence levels
- Risk alerts
- What-if simulation

👉 **Key line:**

“Even when imperfect, it’s better than today’s guesswork.”

🏢 9. Scalability

Q: How does this scale?
A:

- Per-store independence
- Aggregation for regional insights
- Future: cross-store optimization

👉 **Key line:**

“This scales from one store to an entire network.”

🚀 10. What's Next?

Q: What would you build next?
A:

1. Real data integration
2. Learning models
3. Cross-store optimization
4. Autonomous planning

👉 **Key line:**

"We evolve from decision support → decision automation."

🏆 Closing Line (If You Get the Chance)

"Managers don't need more data—they need better decisions, faster.
This is a shift from reactive operations to proactive intelligence."

💡 Pro Tip (Use During Q&A)

- Keep answers **30–45 seconds max**
- Always tie back to:
  - **Decision-making**
  - **Business impact**
- Avoid deep technical rabbit holes unless asked

💧 1) “Your recommendations depend on predictions—what happens when demand is completely unpredictable?”

🎯 Testing:

Robustness under uncertainty

💡 How to answer:

- Acknowledge unpredictability
- Emphasize:
  - confidence levels
  - continuous updates
  - risk-aware decisions

👉 Key idea:

“We don’t eliminate uncertainty—we make it visible and manageable.”

⚡ 2) “Why wouldn’t an experienced manager outperform your system?”

🎯 Testing:

Human vs AI positioning

💡 How to answer:

- Respect experience
- Position system as:

    - augmenting
    - scaling experience

👉 Key idea:

“Great managers are limited by human capacity—our system scales their intuition with data.”

🧠 3) “How do you avoid overwhelming the manager with too many alerts or recommendations?”

🎯 Testing:

UX maturity

💡 How to answer:

- Prioritization layer:
    - only top 3 actions
- severity-based alerts
- context-aware filtering

👉 Key idea:

“We optimize for signal over noise.”

🔄 4) “What’s the cost of a wrong recommendation?”

🎯 Testing:

Risk awareness

💡 How to answer:

- Show you’ve thought about trade-offs:
  - over-prep vs stockout
- mitigation:
  - simulation
  - explainability
  - human override

👉 Key idea:

“We reduce risk exposure, not eliminate it.”

⏱️ 5) “Why would a manager trust this in a high-pressure moment?”

🎯 Testing:

Adoption reality

💡 How to answer:

- trust pillars:
  - transparency (why)
  - consistency

    - quick validation (what-if)

👉 Key idea:

“Trust is built through explainability and control.”

📊 6) “How is this different from existing forecasting tools used in retail/F&B?”

🎯 Testing:

Differentiation

💡 How to answer:

- Traditional tools:
    - forecast only
- You:
    - forecast + recommend + simulate + explain

👉 Key idea:

“We close the loop from prediction to action.”

🧩 7) “How do you handle messy or missing data from stores?”

🎯 Testing:

Real-world readiness

💡 How to answer:

- fallback strategies:
  - heuristics
  - defaults
- degrade gracefully
- surface low confidence

👉 Key idea:

“The system is designed to work even with imperfect data.”

🤖 8) “Is the LLM actually necessary, or is it just a nice UI layer?”

🎯 Testing:

AI justification (deeper)

💡 How to answer:

- separate:
  - deterministic core (decisions)
  - LLM (interaction + explanation)

👉 Key idea:

“The LLM makes the system usable and trustworthy—not just smarter.”

🏢 9) “How would this work across stores with very different patterns?”

🎯 Testing:

Scalability + generalization

💡 How to answer:

- per-store adaptation
- shared patterns where useful
- future: clustering stores

👉 Key idea:

“Global system, locally adaptive decisions.”

🚀 10) “What’s the hardest problem to solve to make this real?”

🎯 Testing:

Depth + honesty

💡 How to answer:

Pick one real challenge:

- data quality
- change management
- trust/adoption

👉 Key idea:

“The hardest part isn’t the model—it’s aligning data and human behavior.”

💣 Bonus Killer Question (Be Ready)

“Why will this succeed where similar systems failed?”

🎯 Testing:

Product insight

💡 How to answer:

- past systems:
  - passive
  - complex
- your approach:
  - proactive
  - simple
  - decision-first

👉 Key idea:

“We’re not adding intelligence to systems—we’re redesigning how decisions are made.”
